

INTEGERS

- The set of integers is: $\mathbb{Z} = \{\dots, -3, -2, -1, 0, 1, 2, 3, \dots\}$.

Consider:

- the **positive** integers Ex.: +4 or 4;
- the **negative** integers Ex.: -7;
- the **null** integer, 0.

The set of non-zero integers is: $\mathbb{Z}^* = \{\dots, -3, -2, -1, 1, 2, 3, \dots\}$.

The set of positive or null integers is: $\mathbb{Z}_+ = \{0, 1, 2, 3, \dots\}$.

The set of negative or null integers is: $\mathbb{Z}_- = \{\dots, -3, -2, -1, 0\}$.

- The set of integers is represented on the **number line** as follows:

The point M has an abscissa value of -4 and the point N has an abscissa value of +6.

- Two numbers are **opposites** if they consist of the same natural number, but are of opposite signs.

The opposite of the integer a is denoted $\text{opp}(a)$

Ex.: -2 and 2 are opposite numbers. Therefore, $\text{opp}(+2) = -2$ and $\text{opp}(-2) = +2$

- 1.** Represent each of the following by an integer.

- a) a loss of \$18: -18 b) 3 km north: +3 c) a retreat of 6 m: -6
 d) an increase of \$70: +70 e) sea level: 0 f) 300 A.D.: +300
 g) the 3rd level underground: -3 h) 5 years from today: +5
 i) an altitude of 2 500 m: +2500

- 2.** The table below shows the results of five students on a mathematics test.

Student's mark	75	66	95	56	48
Deviation from the average	+7	-2	+27	-12	-20

Calculate the average of the marks of these five students. In the above table, indicate the integer which corresponds to the difference between the student's mark and the average.

Average = 68

- 3.** In the following diagram, place the given integers in the appropriate region.

-12, +6, +4, -9, 0, -25, +18, -135, +56

4. On each of the following number lines, determine the abscissa of the points represented.

5. On each of the following number lines, choose an appropriate graduation and place the given points.

6. Place the following historical events on the number line below, using an appropriate graduation. (Dates have been rounded to the nearest ten.)

- | | |
|----------------------------------------|---------------------------------------|
| A: The invention of writing (-3500) | B: The fall of the Roman Empire (480) |
| C: The founding of Rome (-750) | D: The birth of King David (-1000) |
| E: The great pyramids of Egypt (-2500) | F: The iron age (-4000) |

7. a) Give the opposite of each of the following numbers.

1. -7 : +7 2. 8 : -8 3. -6 : +6 4. 0 : 0

b) Does every integer have an opposite? Yes

8. Complete each of the statements below.

- a) The opposite of a positive integer is a negative integer.
 b) The opposite of a negative integer is a positive integer.
 c) The opposite of the integer 0 is 0.
 d) If a is a positive number, then $-a$ is negative.
 e) If a is a negative number, then $-a$ is positive.
 f) If a is the opposite of b , then b is the opposite of a.

9. Consider the integer $a = -9$. Find:

$\text{opp}(a) = \underline{9}$ $\text{opp}(\text{opp}(a)) = \underline{-9}$ $\text{opp}(\text{opp}(\text{opp}(a))) = \underline{9}$

10. If a is an integer, simplify:

$\text{opp}(\text{opp}(a)) = \underline{a}$ $\text{opp}(\text{opp}(\text{opp}(a))) = \underline{-a}$ $\text{opp}(\text{opp}(\text{opp}(\text{opp}(a)))) = \underline{a}$

11. In each case below, determine the values of the abscissas of points M, N and P if, respectively, they are the opposites of the abscissas of points A, B and C.

ACTIVITY 4 Order of Integers

The table below indicates the temperatures at Gaspé, recorded at noon one week in March.

Day	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday
Temperature	-7 °C	-4 °C	+1 °C	-2 °C	+3 °C	-10 °C	-8 °C

a) On which of the following days was it colder?

1. Monday or Saturday? Saturday 2. Tuesday or Wednesday? Tuesday
 3. Wednesday or Friday? Wednesday 4. Monday or Sunday? Sunday

b) Arrange the days in increasing order of temperature.

Saturday, Sunday, Monday, Tuesday, Thursday, Wednesday, Friday

ORDER IN \mathbb{Z}

- When two integers are **positive**, the larger one is the one comprised of the larger natural number. Ex.: $+8 > +2$
- When two integers are **negative**, the larger one is the one comprised of the smaller natural number. Ex.: $-4 > -6$
- When two integers have **opposite signs**, the larger one is the **positive** number. Ex.: $+8 > -10$
- Every positive integer is greater than 0 and every negative integer is less than 0. Ex.: $+7 > 0$ and $-5 < 0$

12. Complete the following numerical statements using the symbol $>$ or $<$.

- a) $-5 < 5$ b) $-3 > -7$ c) $5 > -8$ d) $-4 < 0$
 e) $4 > 0$ f) $-8 < -2$ g) $-12 < 18$ h) $-9 < 3$
